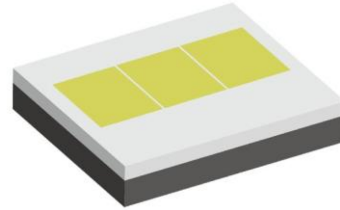
Dong Feng Series
DF-3C



Dong Feng Headlamp series delivers unique brilliant light with outstanding efficiency and elegant design. It's able to meet requirements of output and stability due to its developed and tested to withstand extreme environment conditions and wide range of temperature change. It also provides distinct optical performance and uniform light pattern. With Dong Feng Headlamp series, you will start to experience and enjoy the excellent adventure during driving time.

Features

- Excellent Brightness: 1150 lm@ 1A
- Color : According to ECE/SAE
- High Flux Density (Lux)
- With an Electrically Isolated Thermal Pad Structure

Applications

- Exterior Automotive Lighting
- Daytime Running Light
- High Beam/Low Beam for Headlight

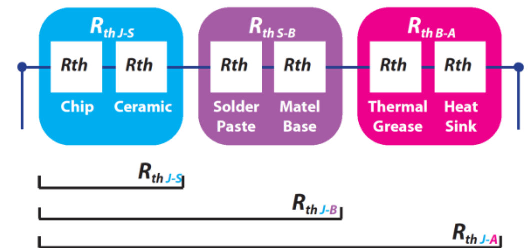
Thermal Management

A high temperature operation condition always easily causes the decrease of flux and the decay of LED dies. The highest operation temperature of a component is able to be found by the indication of junction temperature in its datasheet. The power dissipation ability, the ambient temperature of LED junction, environment, thermal path and its thermal resistance are the main parameters which affect the performance of a LED device. Therefore, the limitation of junction temperature has become an important issue when designing a LED product.

The following paragraphs describe how to determine the junction temperature and a simple ideal to heat sink design. Thermal resistance is the temperature difference across a structure when a unit of heat energy flows through in unit time. For LEDs, temperature difference presents the temperature between a die's PN junction and package substrate. For the same package structure and operating condition, the smaller thermal resistance a LED has, the lower temperature of this LED. With lower operation temperature, a LED would keep its original performance for longer. By estimating the PN junction temperature, users may be aware that the thermal management had been well designed.

From basic thermal equation for thermal resistance : $Rth_{(J\text{-}A)} = \frac{\Delta T_{(J-A)}}{P_D}$

Therefore the junction temperature (T_J) is : $T_J = T_A + Rth_{(J\text{-}A)} \times PD$

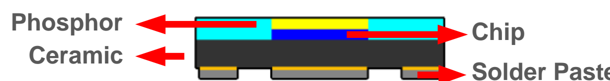


which,

P_D : Power Dissipation = Forward Voltage (V_F) x Forward Current (I_F)

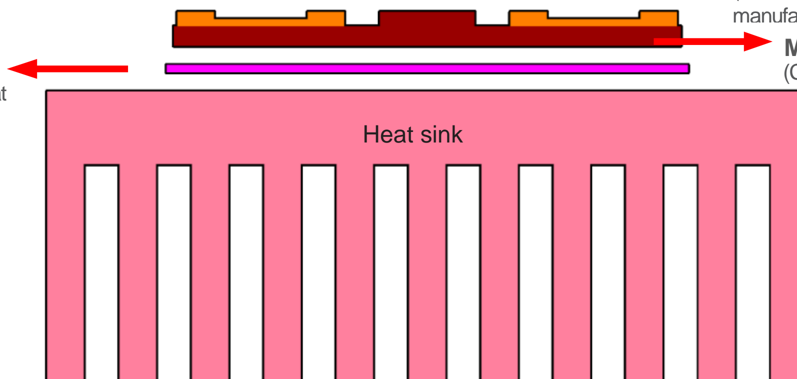
T_A : Ambient Temperature (assume 25°C)

$Rth_{(J\text{-}A)}$: Total Thermal Resistance = $Rth_{(J\text{-}S)} + Rth_{(S\text{-}B)} + Rth_{(B\text{-}A)}$



The temperature of phosphor surface must be well-controlled under 150°C

SMT total void has to be controlled under 10%. (Must have 100% X-ray by self-inspection or SMT manufacturer.)



Metal Base (MCPCB)
(Copper bump PCB is highly preferred.)

Thermal Grease
K(W/m・K)>2 is better for heat conduction with uniformly applied.

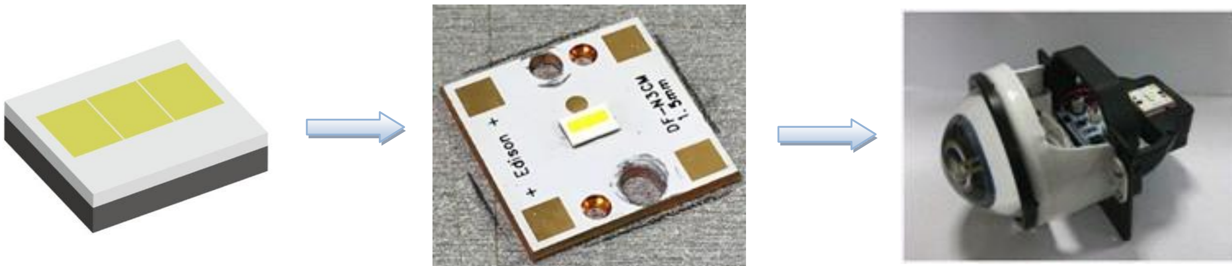
Tips for Thermal Management

Dong Feng products (e.g: 15W) are not recommended to be operating without a heat sink. Through MCPCB, users may realize better performance.



For LEDs, choose an appropriate operation environment and conduct the heat to the air after light on LEDs may maintain the better performance and lifetime. Four major thermal path are as follow:
From heat source (component) to heat sink. (By conduction)
Conduction within the heat sink to its surface. (By conduction)
Transfer from the surface to the surrounding air. (By convection)
Emit heat from the heat sink surface. (By Radiation)

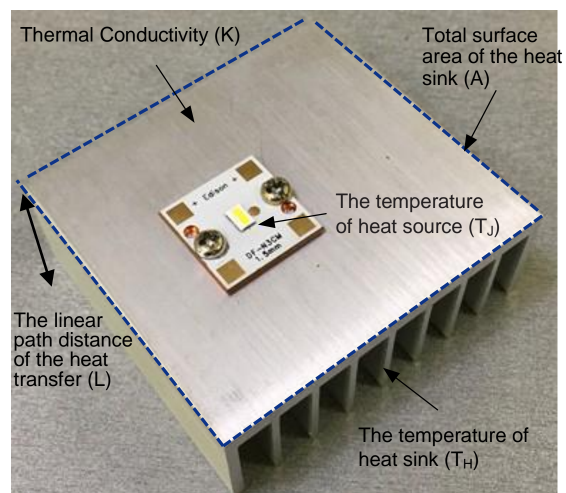
Path1 : The contact surface of the MCPCB and heat sink are not perfectly flat, they are not able to meet each other completely. Air between these two materials will result in high thermal resistance and reduce the effect of heat transfer. To enhance the ability of thermal conduction, one common method is applying thermal grease between the two interfaces and uses the screws to enforce the adhesion between two surfaces.

Path2 : Temperature gradient depends on the time of a heat sink. The total heat flux(Q) consists of:

1. The temperature difference between heat source (T_J) and heat sink (T_H)
2. Thermal Conductivity (K) of the heat sink
3. Total surface area of the heat sink (A)
4. The linear path distance of the heat transfer (L)

This is represented by the Fourier's Law as follow:

$$Q = K \times A \times \frac{\Delta T}{L}$$



EDISON Lighting Design Manufacturing Service

By choosing a higher thermal conductivity, increasing the surface area of the heat sink (add the number of fins) or shorten the distance of the linear path of heat dissipation may improve the loss of heat flux per unit time. Among all materials, metal is the best choice because of its high thermal conductivity.

List of thermal conductivity for some usual materials

Material	K(W/m·K)
Copper	391
C1100	384
Aluminum	230
5000 Series	225
ADC-12	96.2
Magnesium	156
Air	0.024

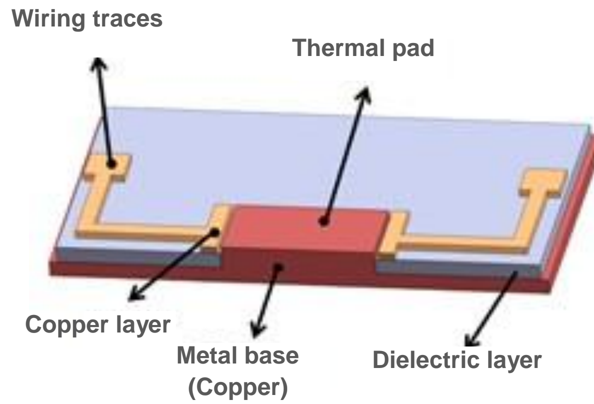
Path3 : Heat dissipation includes convection and radiation. Those two types of transfer are proportional to the surface area of the heat sink. Adding the number of fin may increase the total surface area. However, too many fins may cause inhabitation of convection. There are many other thermal management methods such as install a fan to reach obliged convection. But this design may cause the issues such as noise or circuit design problem.

Path4 : Compare with an unfinished heat sink, the one that covered by high emissivity material, such as ceramic powder or deep color paint, usually has better radiation ability. Both anodizing and etching are also effective to increase the thermal dissipation.

Key points for thermal management:
- The contact surface’s flatness and smoothness of the component and heat sink.
- The total surface area of heat sink.
- The selection of heat sink material.
- Optimum number of fins. (Aerodynamic optimization)

Recommended PCB Design

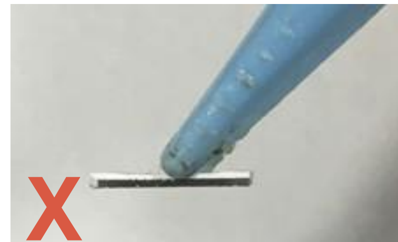
The PCB design can affect the thermal performance of the end product. In order to reduce the thermal resistance of PCB, heat must transfer through metal without dielectric layer. The figure below shows the cross-section of PCB.



Handling Manual

Dong Feng Series LED use phosphor film on the emitting surface, sealing by silicon. LED may be deformed or destructed if excessive force is applied.
When manually handling the LED, please use the plastic tweezers instead of the metal one. Avoid contacting to the white silicon structure which will cause damage to the package.

- Plastic Tweezers



- Metal Tweezers
